## Experiment - 4

**Student Name: Vivek Kumar**

**Branch: BE-CSE(LEET)**

**Semester: 5<sup>th</sup>**

**Subject Name: DAA Lab**

**UID: 21BCS8129**

**Section/Group: 20BCS-WM-616/A**

**Date of Performance: 16/08/2022**

**Subject Code: 20CSP-312**

### 1. Aim/Overview of the practical:

a) Code to Insert and Delete an element at the beginning and at end in Doubly and Circular Linked List.

### 2. Task to be done/ Which logistics used:

Insert and delete an element from a doubly circular linked list.

### 3. Requirements (For programming-based labs):

- Laptop or PC.
- Operation system (Mac, Windows, Linux, or any)
- Vs-Code with MinGw or any C++ Compiler

### 4. Algorithm/Flowchart (For programming-based labs):

1. Start.

2. For insertion in the end if the list is empty start pointer points to the first node the list. If the list is non empty previous pointer of M points to last node, next pointer of M points to first node and last node's next pointer points to this M node and first node's previous pointer points to this M node

3. For Insertion at the beginning if the list is empty T next pointer points to first node of the list, T previous pointer points to last node the list, last node's next pointer points to this T node, first node's previous pointer also points this T node and shift 'Start' pointer to this T node.

4. If the list is not empty, then we define two pointers curr and prev\_1 and initialize the pointer curr points to the first node of the list, and prev\_1 = NULL.

5. Traverse the list using the curr pointer to find the node to be deleted and before moving from curr to the next node, every time set prev\_1 = curr.

6. If the node is found, check if it is the only node in the list. If yes, set start = NULL and free the node pointing by curr.

7. If the list has more than one node, check if it is the first node of the list. The condition to check this is (curr == start). If yes, then move prev\_1 to the last node (prev\_1 = start -> prev).

8. If curr is not the first node, we check if it is the last node in the list. The condition to check this is (curr -> next == start). If yes, set prev\_1 -> next = start and start -> prev = prev\_1. Free the node pointing by curr.

9. If the node to be deleted is neither the first node nor the last node, declare one more pointer temp and initialize the pointer temp points to the next of curr pointer (temp = curr->next). Now set, prev\_1 -> next = temp and temp -> prev = prev\_1. Free the node pointing by curr. 8.

10. Stop and print the result.

### 5. Steps for experiment/practical/Code:

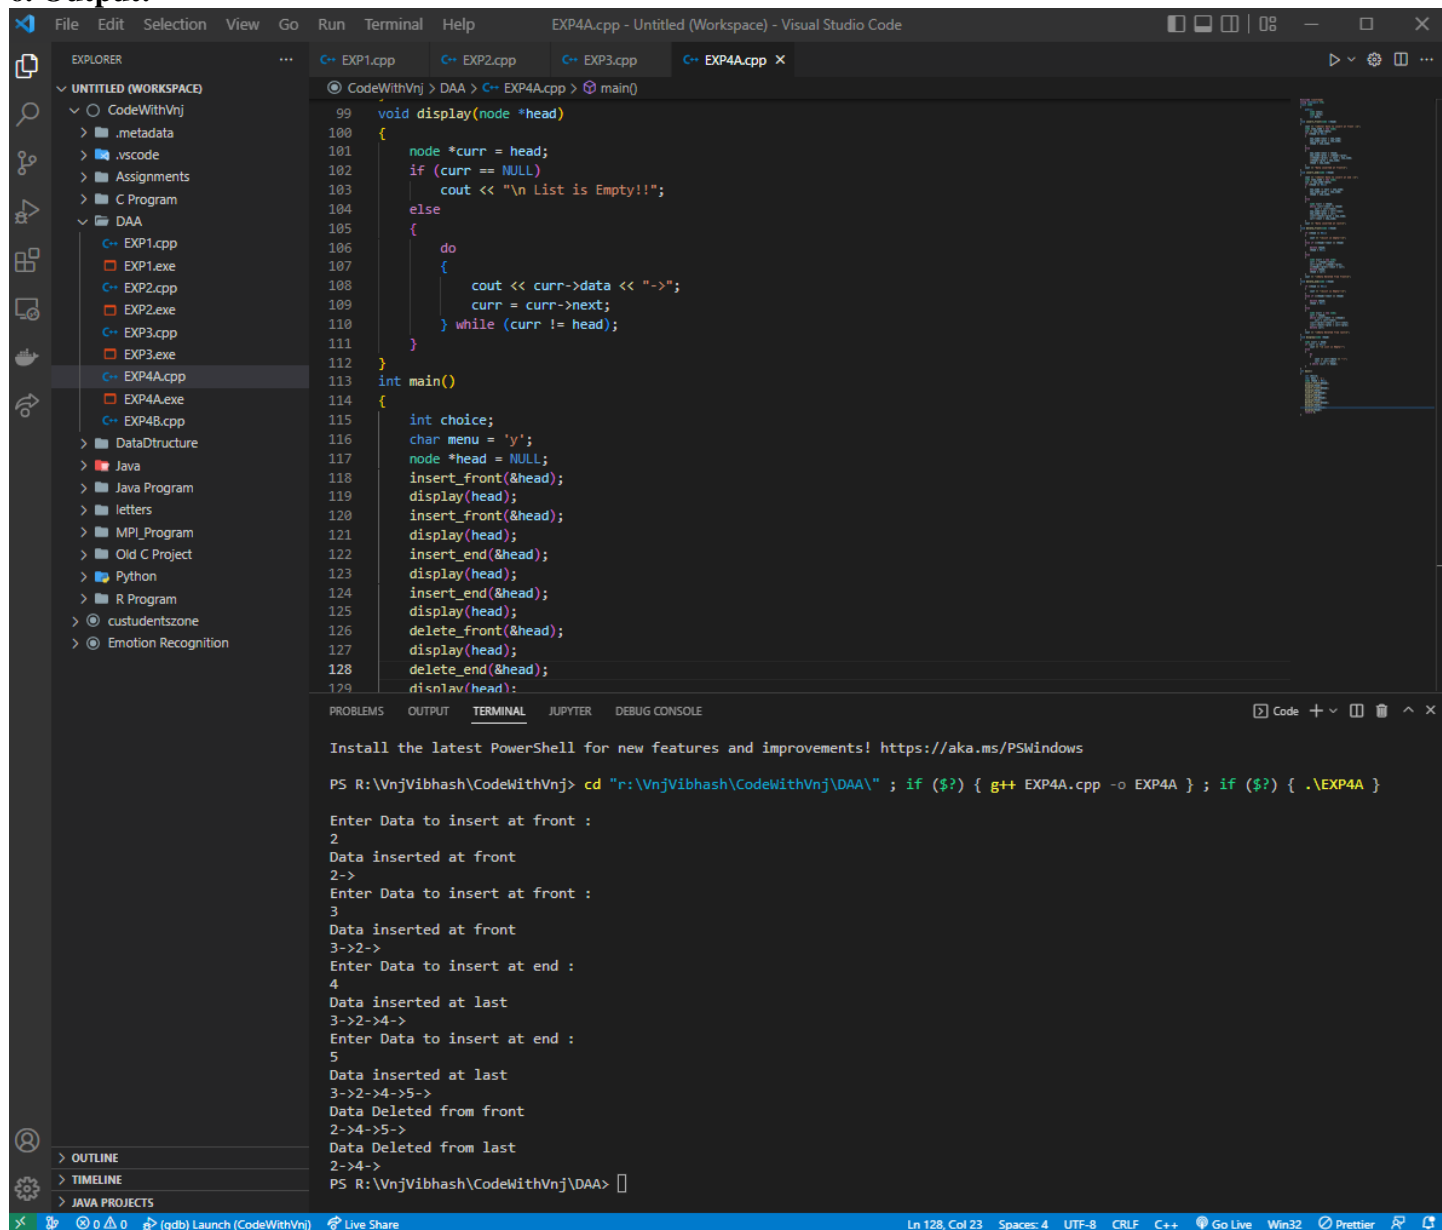

```
#include <iostream>
using namespace std;
class node
{
public:
    node *next;
    node *prev;
    int data;
};
void insert_front(node **head)
{
    cout << "\nEnter Data to insert at front :\n";
    node *new_node = new node;
    cin >> new_node->data;
    if (*head == NULL)
    {
        new_node->next = new_node;
        new_node->prev = new_node;
        *head = new_node;
    }
    else
    {
        new_node->next = *head;
        new_node->prev = (*head)->prev;
        ((*head)->prev) -> next = new_node;
        (*head)->prev = new_node;
        *head = new_node;
    }
    cout << "Data inserted at front\n";
}
void insert_end(node **head)
{
    cout << "\nEnter Data to insert at end :\n";
    node *new_node = new node;
    cin >> new_node->data;
    if (*head == NULL)
    {
        new_node -> next = new_node;
```

```
new_node->prev = new_node;
*head = new_node;
}
else
{
    node *curr = *head;
    while (curr->next != *head)
        curr = curr->next;
    new_node->next = curr->next;
    new_node->prev = curr;
    (curr->next)->prev = new_node;
    curr->next = new_node;
}
cout << "Data inserted at last\n";
}
void delete_front(node **head)
{
    if (*head == NULL)
    {
        cout << "\nList in empty!!\n";
    }
    else if ((*head)->next == *head)
    {
        delete *head;
        *head = NULL;
    }
    else
    {
        node *curr = new node;
        curr = (*head)->next;
        curr->prev = (*head)->prev;
        ((*head)->prev)->next = curr;
        delete *head;
        *head = curr;
    }
    cout << "\nData Deleted from front\n";
}
void delete_end(node **head)
{
    if (*head == NULL)
    {
        cout << "\nList is Empty!!\n";
    }
    else if ((*head)->next == *head)
```

```
{
    delete *head;
    *head = NULL;
}
else
{
    node *curr = new node;
    curr = *head;
    while (curr->next != (*head))
        curr = curr->next;
    (curr->prev)->next = curr->next;
    (curr->next)->prev = curr->prev;
    delete curr;
}
cout << "\nData Deleted from last\n";
}
void display(node *head)
{
    node *curr = head;
    if (curr == NULL)
        cout << "\n List is Empty!!";
    else
    {
        do
        {
            cout << curr->data << "->";
            curr = curr->next;
        } while (curr != head);
    }
}
int main()
{
    int choice;
    char menu = 'y';
    node *head = NULL;
    insert_front(&head);
    display(head);
    insert_front(&head);
    display(head);
    insert_end(&head);
    display(head);
    insert_end(&head);
    display(head);
    delete_front(&head);
```

```
display(head);
delete_end(&head);
display(head);
return 0;
}
```

## 6. Output:

The screenshot shows the Visual Studio Code interface with the file explorer on the left, the source code editor in the center, and the terminal at the bottom. The source code for EXP4A.cpp is as follows:

```
99 void display(node *head)
100 {
101     node *curr = head;
102     if (curr == NULL)
103         cout << "\n List is Empty!!";
104     else
105     {
106         do
107         {
108             cout << curr->data << "->";
109             curr = curr->next;
110         } while (curr != head);
111     }
112 }
113 int main()
114 {
115     int choice;
116     char menu = 'y';
117     node *head = NULL;
118     insert_front(&head);
119     display(head);
120     insert_front(&head);
121     display(head);
122     insert_end(&head);
123     display(head);
124     insert_end(&head);
125     display(head);
126     delete_front(&head);
127     display(head);
128     delete_end(&head);
129     display(head);
130 }
```

The terminal output shows the execution of the program, which prompts the user to enter data to insert at the front and end, and to delete nodes from the front and end. The output is as follows:

```
PS R:\VnjVibhash\CodeWithVnj> cd "r:\VnjVibhash\CodeWithVnj\DAA" ; if ($?) { g++ EXP4A.cpp -o EXP4A } ; if ($?) { .\EXP4A }

Enter Data to insert at front :
2
Data inserted at front
2->
Enter Data to insert at front :
3
Data inserted at front
3->2->
Enter Data to insert at end :
4
Data inserted at last
3->2->4->
Enter Data to insert at end :
5
Data inserted at last
3->2->4->5->
Data Deleted from front
2->4->5->
Data Deleted from last
2->4->
PS R:\VnjVibhash\CodeWithVnj\DAA>
```

## Learning outcomes (What I have learnt):

1. How to circular linked list concept
2. How to Insert a node at front & end
3. How to delete a node from front & end

### 1. Aim/Overview of the practical:

b) Code to push & pop and check Isempty, Isfull and Return top element in stacks using templates.

### 2. Task to be done/ Which logistics used:

Using C++ templates perform push and pop operation on stacks.

### 3. Requirements (For programming-based labs):

- Laptop or PC.
- Operation system (Mac, Windows, Linux, or any)
- Vs-Code with MinGw or any C++ Compiler

### 4. Algorithm/Flowchart (For programming-based labs):

1. Start.
2. First we will define the size.
3. Then we will create a class template called Stack.
4. Then we will check the top of stack using - template <class T> Stack<T>::Stack() { top = -1;
5. Then we will push elements into the stack using templates.
6. Using template, we will check whether the stack is empty or is full.
7. The we will pop an element of stack using templates.
8. We will check the top element using template <class T> T Stack<T>::topElement().
9. Print the result.
10. Stop.

### 5. Steps for experiment/practical/Code:

```
#include <iostream>
#include <string>
using namespace std;
#define SIZE 5
template <class T>
class Stack
{
public:
    Stack();
    void push(T k);
    T pop();
    T topElement();
    bool isFull();
    bool isEmpty();

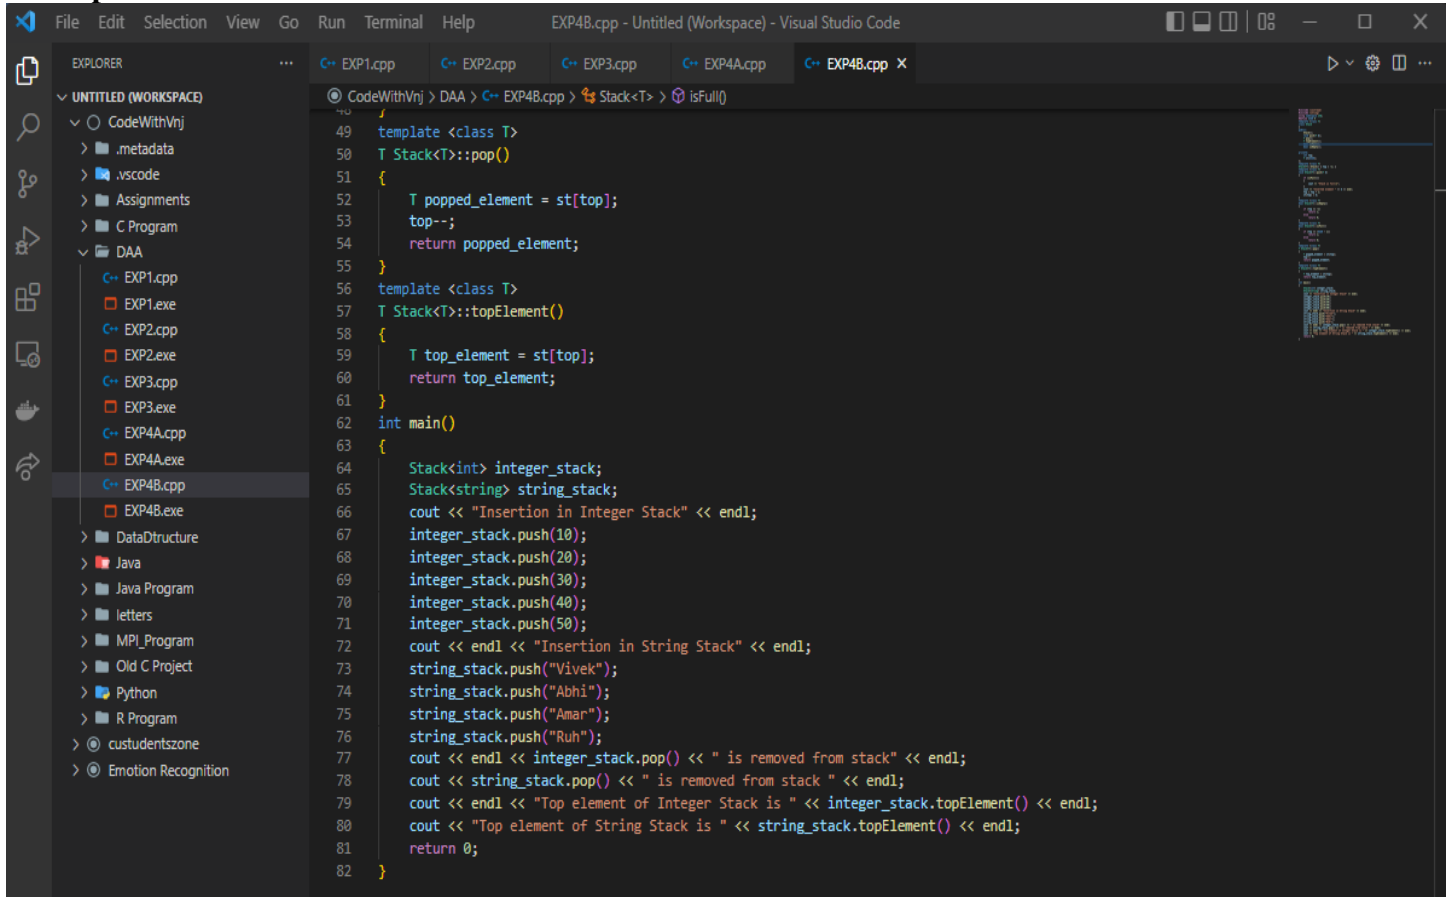

private:
    int top;
    T st[SIZE];
};
```

```
template <class T>
Stack<T>::Stack() { top = -1; }
template <class T>
void Stack<T>::push(T k)
{
    if (isFull())
    {
        cout << "Stack is full\n";
    }
    cout << "Inserted element " << k << endl;
    top = top + 1;
    st[top] = k;
}
template <class T>
bool Stack<T>::isEmpty()
{
    if (top == -1)
        return 1;
    else
        return 0;
}
template <class T>
bool Stack<T>::isFull()
{
    if (top == (SIZE - 1))
        return 1;
    else
        return 0;
}
template <class T>
T Stack<T>::pop()
{
    T popped_element = st[top];
    top--;
    return popped_element;
}
template <class T>
T Stack<T>::topElement()
{
    T top_element = st[top];
    return top_element;
}
int main()
{
```

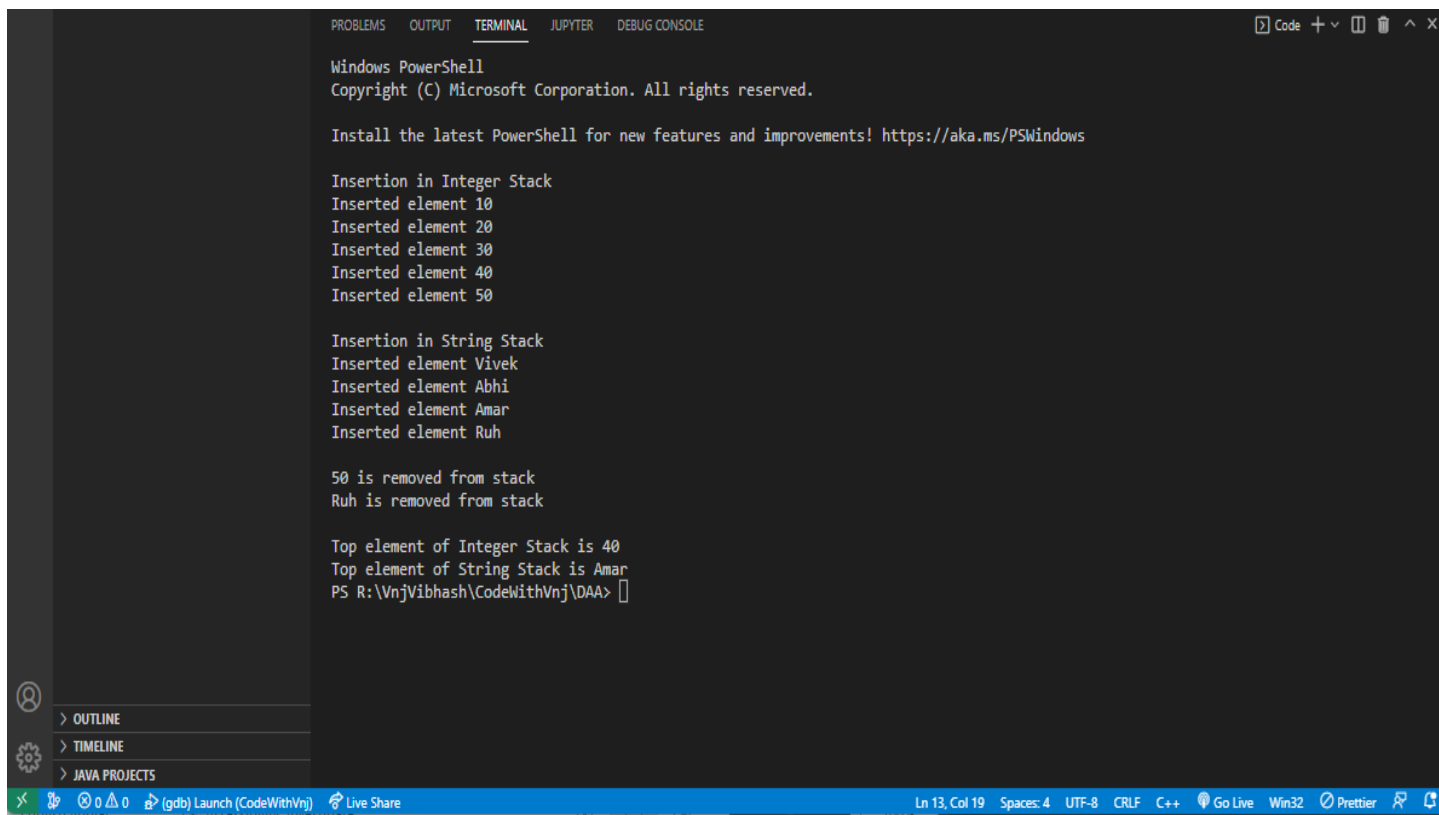

```
Stack<int> integer_stack;
Stack<string> string_stack;
cout << "Insertion in Integer Stack" << endl;
integer_stack.push(10);
integer_stack.push(20);
integer_stack.push(30);
integer_stack.push(40);
integer_stack.push(50);
cout << endl << "Insertion in String Stack" << endl;
string_stack.push("Vivek");
string_stack.push("Abhi");
string_stack.push("Amar");
string_stack.push("Ruh");
cout << endl << integer_stack.pop() << " is removed from stack" << endl;
cout << string_stack.pop() << " is removed from stack " << endl;
cout << endl << "Top element of Integer Stack is " << integer_stack.topElement() << endl;
cout << "Top element of String Stack is " << string_stack.topElement() << endl;
return 0;
}
```

## 6. Output:

```
CodeWithVnj > DAA > C++ EXP4B.cpp > Stack<T> > isFull()
49  template <class T>
50  T Stack<T>::pop()
51  {
52      T popped_element = st[top];
53      top--;
54      return popped_element;
55  }
56  template <class T>
57  T Stack<T>::topElement()
58  {
59      T top_element = st[top];
60      return top_element;
61  }
62  int main()
63  {
64      Stack<int> integer_stack;
65      Stack<string> string_stack;
66      cout << "Insertion in Integer Stack" << endl;
67      integer_stack.push(10);
68      integer_stack.push(20);
69      integer_stack.push(30);
70      integer_stack.push(40);
71      integer_stack.push(50);
72      cout << endl << "Insertion in String Stack" << endl;
73      string_stack.push("Vivek");
74      string_stack.push("Abhi");
75      string_stack.push("Amar");
76      string_stack.push("Ruh");
77      cout << endl << integer_stack.pop() << " is removed from stack" << endl;
78      cout << string_stack.pop() << " is removed from stack " << endl;
79      cout << endl << "Top element of Integer Stack is " << integer_stack.topElement() << endl;
80      cout << "Top element of String Stack is " << string_stack.topElement() << endl;
81      return 0;
82  }
```
